
ABSTRACT

A1 A label for in-mold decorating, which comprises (I) a thermoplastic resin film base layer, (II) an interlayer overlying said base layer and comprising (a) a thermoplastic resin composition, and (b) at least one antistatic agent, and (III) a heat-sealable resin layer overlying said interlayer. The label for in-mold decorating can be manufactured without developing a resin-like stain or causing roll contamination. It is free from inconveniences arising from insufficient antistatic properties in printing, cutting, blanking, and inserting into a mold, irrespective of the working environment. In addition, it exhibits a high adhesive strength upon application to a molded container.
